

SPACEADOM — EMERGENCY CARD

Pin this next to the desk. Version 1.0.107 · 2026-09-07 · full detail in
Spaceadom-Handbook.pdf

1. THE BACKUP

Where it lives:

E:\Spaceadom-Backup-2026-09-07\

What is **irreplaceable** inside it — **01-SECRETS-DO-NOT-SHARE**: the updater signing key (spaceadom.key + its password file), the Sentry DSN, and the MSIX identity. **Lose the signing key and every installed copy of Spaceadom can never accept an update again — forever.** Never regenerate it; back it up, never rebuild it.

2. THE FOUR COMMANDS THAT MAKE A RELEASE

(After bumping the version to match in package.json, tauri.conf.json and Cargo.toml, and staging with `git add -A`.)

```
git commit -m "1.0.107 - <what changed>"
```

```
git tag v1.0.107
```

```
git push
```

```
git push --tags
```

The tag push is what triggers GitHub Actions to build, sign, and publish.

3. THE FIVE COMMANDS THAT ROLL BACK TO A KNOWN-GOOD BUILD

```
taskkill /IM spaceadom.exe /F
```

```
Copy-Item "$env:APPDATA\Spaceadom\config.json" "$env:USERPROFILE\Desktop\config-backup.json"
```

```
D:\Claude-Projects\SpaceToggle-V14\all-versions\Spaceadom_<known-good-version>_x64-setup.exe /S
```

```
Start-Process "$env:LOCALAPPDATA\Spaceadom\spaceadom.exe"
```

```
(Get-Item "$env:LOCALAPPDATA\Spaceadom\spaceadom.exe").VersionInfo.FileVersion
```

Step 5 is not optional — `setup.exe /S` has exited 0 having replaced nothing, four separate times. Never trust the exit code.

4. THE TWO GREPS THAT DIAGNOSE THE KEYBOARD GOING DEAF

```
grep "hook liveness split" debug.log | tail
```

```
grep "KEYBOARD DEAF, PROVEN" debug.log | tail
```

mouse: above 0 with primary_real:0 reference:0 means the keyboard hooks were evicted while the pump is still healthy — not “nobody typed.” Log file:

%APPDATA%\Spaceadom\debug.log.

5. NEVER DOUBLE-CLICK AN OLD .MSI

Only ever run the `setup.exe` files from `all-versions\`. Do not double-click a `.msi` from that folder — a `.msi` double-clicked on 2026-08-30 registered the live per-user install folder as its own, and that registration is exactly what `msiexec /X` later used to delete the running app.
